

Association of IterativeLSI / Harmony dimensions with known covariates

Columns are the LSI / Harmony dimensions themselves (per-sample means), not principal components of them.  
Tile label = adjusted R^2, floored at 0 (a negative value means the covariate explains less than its degrees of freedom would by chance); exact values in Table S1B. Shading = BH-adjusted significance.  
Bracketed unit: covariates constant within a donor are tested at the DONOR level (repeat draws collapsed); covariates that vary within a donor are tested per sample with a donor random intercept.
