

Association of IterativeLSI / Harmony dimensions with known covariates

Columns are the LSI / Harmony dimensions themselves (per-sample means), not principal components of them.
Tile label = variance explained (partial R²). Shading = BH-adjusted significance, which already accounts for the degrees of freedom each covariate uses. Adjusted R² is in Table S1B.
Bracketed label = one observation in that test. 'per donor': the covariate is constant within a donor, so repeat draws are collapsed. 'per sample, donor-adjusted': the covariate varies within a donor, so samples are kept separate and a donor random intercept absorbs the repeated sampling.
