

Association of IterativeLSI / Harmony dimensions with known covariates

Columns are the LSI / Harmony dimensions themselves (per-sample means), not principal components of them.
Tile label = variance explained (partial R^2). Shading = BH-adjusted significance, which already accounts for the degrees of freedom each covariate uses. Adjusted R^2 is in Table S1B.
Bracketed unit: covariates constant within a donor are tested at the DONOR level (repeat draws collapsed); covariates that vary within a donor are tested per sample with a donor random intercept.
