

TF-activity variance attributable to exposure condition, within cell type and cohort

Median over 286 TF motifs per cell type and cohort. Plasma excluded (too few cells per pseudobulk).

Donor is fitted only where the design supports it (donor_modelled in the accompanying table): cohorts without it carry between-donor variation in the condition fraction, so values compare between cell types but not between cohorts.

Boxes are quartiles over motifs; whiskers only, outliers not drawn; axis capped at 0.4.
